Compact cryogenic cooling for small sample chambers from +100°C (+212°F) to -180°C (-292°F)

To obtain rapid cooling speeds and very low temperatures, sometimes you have to switch from conventional mechanical cooling to cryogenic cooling. With this scenario in mind, KGW ISOTHERM has developed a new KALTGAS system. In it, a sample chamber is filled with cryogenic nitrogen gas, enabling very low temperatures to be reached at high cooling speeds. The KALTGAS system is highly compact, featuring a flanged end for connecting a variety of glass or metal chambers directly to the gas outlet.

KALTGAS is a tempering system that utilizes the very low temperature of liquid nitrogen as a cooling agent. The Jet vaporizes the liquid nitrogen in a cryogenic container, producing a steady cryogenic gas flow. This LN2 vaporizer (Jet) can be adjusted to minimize liquid nitrogen consumption and to change both the cooling rate and the volume of the gas flow. The cryogenic gas flow is then piped through a vacuum-insulated metal line (N₂ gas line) to a heat exchanger (heater). The heat exchanger is designed to heat the cold gas flow to the desired temperature. The final product, a clearly quantified gas flow exiting the gas outlet at a clearly defined temperature, is ready for use as a cooling agent. A KALTGAS system needs only a few minutes to produce a cold gas flow with a temperature of -170°C (-274°F). Configuring the KALTGAS system to any customer's individual environment is possible thanks to various temperature controllers that can be embedded inside the safety control unit. Those temperature controllers are available with or without interfaces. By using an optimized temperature controller, a temperature stability of ± 0.1°C can be achieved. With the standard safety control unit (SC5), a temperature stability of better than ± 0.2°C can be achieved. This steady gas flow can then be used to temper a chamber flanged to the system.

In addition to their high cooling speed and good control stability, another significant advantage of KALTGAS systems is their modular design. Sensors, electronic components, test tubes and all kinds of other items can be tempered simply by exchanging the tempering chamber.

The TG-KKK 63/50 KALTGAS system includes a standard safety control unit SC5 (a temperature controller with current value/set point display and a safety controller with interface), a KF-NW 50 siphon with an LN2 vaporizer (Jet), a removable, evacuable compact N₂ gas system with an integrated post-heating module (heater), a PT100 temperature sensor and a vacuum pump with accessories.

Technical data for

Model TG-KKK 63/50

- LN2 vaporizer (Jet)= 500 watts
- Heater = 630 watts
- LN2 consumption = 1.1l/h to 11l/h (liters per hour)
- N2 gas line = V2A, length 1.8 meters, removable, with vacuum pump for LN2 container with KF NW 50

Order No.: TG-KKK 63/50

Accessories

- LN2 container with 20 to 300 liter capacity
- glass chamber (size according to customer specifications)
- stainless steel chamber (size according to customer specifications)

KALTGAS TOOL

Software to control kaltgassystems

The user interface is shown in the following diagram:

Settings

- Sensor and properties
- a) Linearization
- b) Offset: "0" spot offset
- c) type of sensor

Display

- set the upper prompt of controller
- set the power prompt of controller
- unit °C or K
- Decimal place of the Display of Temperature

Abstract

- define and set the desired value,
- set the max lower desired value,
- set the max upper desired value

Device Parameters

The Device Parameters dialog box contains the following settings:

- Sensor 1:** Linearization: Pt100; Offset: 0,0; Type: Resistance thermometer in 3-wire ci
- Sensor 2:** Linearization: Pt100; Offset: 0,0; Type: Resistance thermometer in 3-wire ci
- Generic:** Binary Output 1: Controller output 1; Binary Output 2: No function; SPL: -180,0; SPH: 120,0 200
- Display:** Upper Display: Analog input 1; Lower Display: Analog input 2; Display Type: Celsius; Decimal Point: One decimal place

Buttons at the bottom: Read Current Parameters, Set Standard Parameters, Autotune Heater, Autotune Chamber, Close.

SC 5 safety control unit

The SC 5 safety controller has three functional components. The first component is the temperature controller. It allows users to set the temperature set point of the gas flow at the front of the control unit. The temperature controller then shows the current and the set point temperatures separately. In addition, this controller has an RS 485 interface allowing users to address the controller with software and to specify temperature ramps. The controller also has an auto tuning function where the controller automatically searches for and reads in the control parameters required to reach a high level of control stability. The controller can either control the KALTGAS system using its own internal temperature sensor, or it can be manually switched to the second, internal temperature sensor (e.g., on the sample).

The second component is the heating element safety monitor. It monitors the two heating elements for overheating. Should the internal temperature of either of the two heating elements (LN2 vaporizer (Jet) and heater) rise above the specified safety temperature, the safety controller shuts the KALTGAS system off and sounds an alarm. The only way to turn on the system again is manually.

The third component is the LN2 vaporizer (Jet). The gas rate is adjusted with a control knob, with possible manual settings for the gas rate ranging from 0 to 100 %. The resulting volume of cold N₂ gas depends on the Jet power and the specified vaporizer rate. The Jet is available in ratings from 100 to 1000 watts. For an Jet with a rating of 1000 watts, that translates into a maximum N₂ gas production of over 14,000 litres of cold gas per hour. (A Jet with 100 watts evaporates approx. 2 litres of LN2 per hour; 1 litre of LN2 produces approx. 700 litres of N₂ gas.)
